设备需要的 nv 文件大小是 7M，但是系统里 NV 分区实际大小是 8M，备份读出来的 8M 文件用不了，要改成 7M 才行，不然基带校验不过。

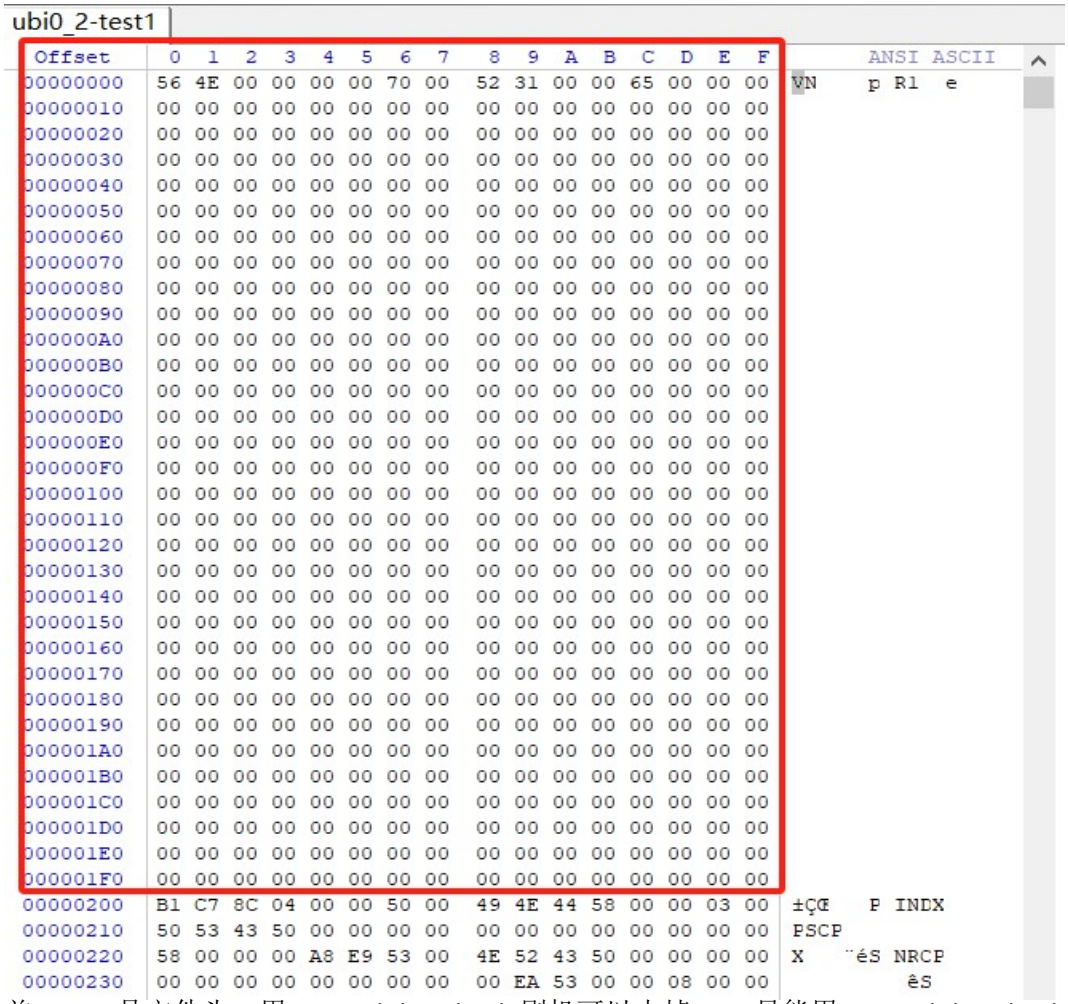

刷机 pac 里的 udx710-module.xml 要把 nr_fixnv1 的大小也改成 0x700000

U2S 备份的还多个文件头，也要去掉，researchdownload 备份的就自动去掉 NV 文件头了

如果不确定设备 nv 分区大小，可以用 U2S 或 ADB 备份出来，然后 winhex 看文件头

前 0x200 是文件头，用 researchdownload 刷机可以去掉，nv 只能用 researchdownload，不能 adb 或者 fastboot 刷，他刷进去的时候要软件添加文件头和校验，adb 分区表里的 nv 分区不准，nv 分区实际大小是不一样的(注释：之前卡在系统里看 nv 分区是 8M，FM650 的 PAC 也写的 8M，就以为是 8M 没问题，后来找几个好用的设备抓出来对比才发现这个文件头的大小有定义，还有就是系统里也有一个参考/mnt/data/modem.ini)ro.vendor.modem.fixnv_size = 0x700000)

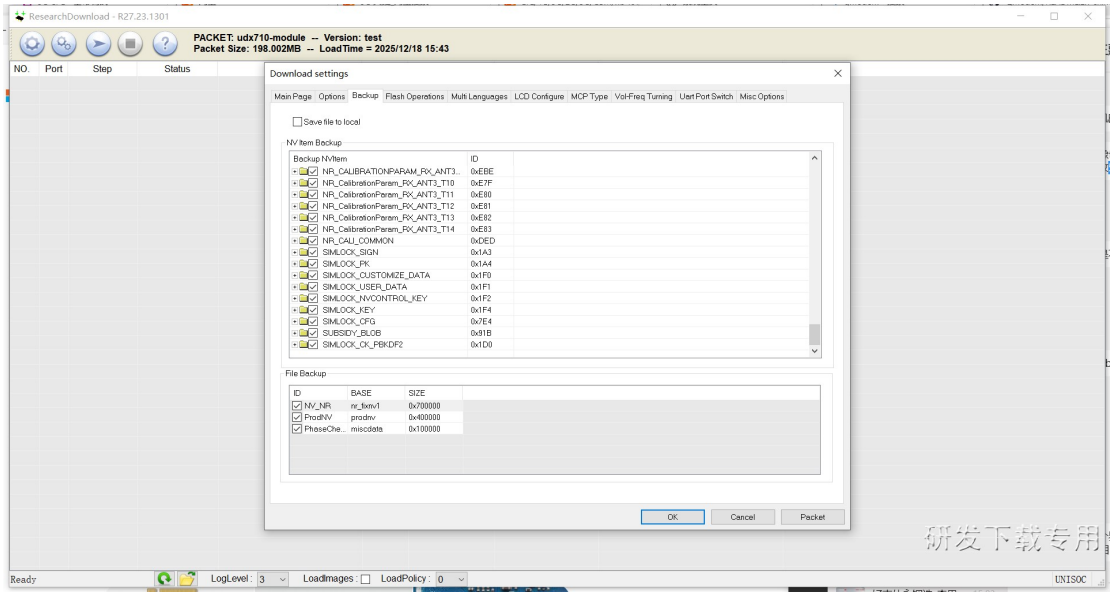

修改 pac 后的文件刷进去可以开启 adb 修改下面几个配置文件 userdata 分区里的

```
root@udx710-module:~# cat /mnt/data/usbenum.ini
[machine]
machine=udx710-module
[property]
virtualcn=0
diag=1
log=1
debug=1
usbch=mode0
iq_vser=close
udc=29100000.dwc3
AfterPowerLoss=0
#virtualcn 0-rndis|1-ecm|2-ncm|3-mbim|4-8*AT|5-1*ecm|6-2*ecm|7-3*ecm|8-4*ecm|9-1*ncm|10-2*ncm|11-3*ncm|12-4*ncm|13-test
```

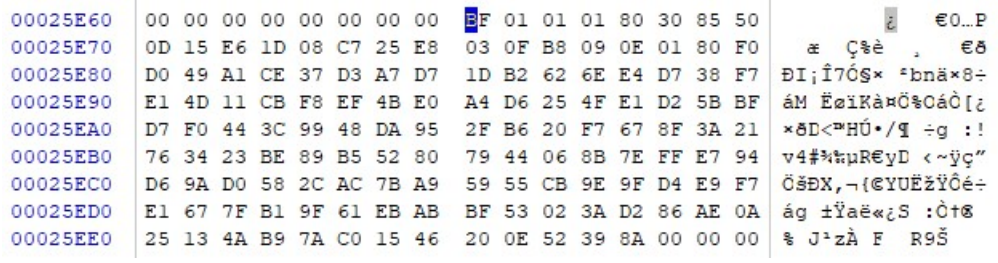

修改 simblock 密码，ID 可以在 hex 文件里查到

researchdownload 里的备份，以找个好用的 nv 文件，把对应 ID 的 hex 部分覆盖到你要修改的文件，紫光 nv 有 licence 绑定验证与 soc 绑定，把 licence 部分搬运到另一个 nv 文件，刷进去是可以的，改了 nv 文件，要用 researchdownload 刷才行，因为有校验。

licence 部分的要用二进制工具截出来找个 nv 剪贴到原位置，比如原始 nv 搜索 bf010101，就是 licence ， 然后在目标 nv 文件也搜索 bf010101 ，找到对应位置，从源文件把这段二进制复制到目标文件对应的 bf010101 位置，覆盖就行。

NV 脚本提取 simlock 示列如下执行命令 python.exe '.\read_nvitem.py' .\nr_fixnv1bin -s 0x7e4

注：脚本是根据 researchdownload 源码做的，不一定 100%准确，试过 licence 没问题。
